FOREWORD

The conservation of California's water resources requires the best use of available water supplies. Reclamation of water from wastes must be considered in any comprehensive evaluation of water management alternatives to meet future water needs. Waste water reclamation, the reuse of treated waste waters, represents an increasingly significant source of water supply which may be used in lieu of, or in exchange for, existing water supplies, while at the same time, reducing the amount of waste water to be discharged. Further, reclamation can provide a source of water, which otherwise would not be available, for use in enhancing environmental surroundings such as irrigated forest greenbelts, landscaping, or parks and artificial lakes.

The Bulletin 68 series, which presents a statewide inventory of waste water production and reclamation practices, is published annually. It presents a compilation of readily available data and information on a statewide basis. These data and information are made available from files within the Department; from the files of the California Regional Water Quality Control Boards; from local and state agencies; from studies, investigations and technical literature; and from other public and private sources.

ABSTRACT

This bulletin presents a statewide inventory of readily available information on municipal, industrial, and domestic waste water production and waste water reclamation practices in California for 1970 and 1971. Data are presented for waste waters being discharged by local governments (cities, counties, districts, and state agencies), by federal installations and by private enterprises. About 175,000 acre-feet of water was reclaimed and reused from the nearly 2.3 million acre-feet of waste water reported by 766 dischargers in 1970, and about 190,000 acre-feet of water was reclaimed and reused from the nearly 2.5 million acre-feet of waste water reported by 805 dischargers in 1971. In addition, in 1970, some 339,000 acre-feet of treated municipal and industrial waste water, and 409,000 acre-feet in 1971, were incidentally reclaimed by being returned to streams, lakes, reservoirs, and ground water basins, thereby becoming available for reuse.

INTRODUCTION

The Department of Water Resources has compiled this report from available sources to satisfy the continuing demand for information on the status of waste water reclamation in California.

The objective of this report series is to present a summary of the status of municipal, industrial, and domestic waste water production and water reclamation practices in the State by local governments (cities, counties, districts, and state agencies), at federal installations and by private enterprises.

Since only readily available information sources were explored, it is recognized that the listings may not include all waste water discharges or reclamation. However, the listings are believed to be reasonably complete for municipal and federal installation discharges, less so for specific discharges by private enterprises.

This inventory is a part of a continuing series of studies to evaluate and promote reclaimed waste water as an integral part of the California Water Plan. The study approach is threefold: (1) conduct annual inventories of waste water production and reclamation in California, (2) make areal overview studies in which we evaluate the potential of reclaimed water to meet water requirements, and (3) investigate technical and economic factors involved in reclamation and study the

feasibility of specific projects. Waste water reclamation offers partial fulfillment of some increasing water demands, particularly in major coastal metropolitan areas, and it can extend the utility and upgrade the quality of water supplies.

WASTE WATER PRODUCTION

Municipal, industrial, and domestic waste water production only is reported. Irrigation return flows generally are returned directly to the freshwater cycle and remain a part of the total usable water supply. Highly mineralized agricultural waste water, such as that in Imperial and Coachella Valleys, which is discharged to Salton Sea, would not be suitable for reclamation and reuse as a freshwater supply without first undergoing demineralization.

Sewerage systems producing less than 10 acre-feet of waste water per year were not reported, and no attempt was made to inventory or include home domestic systems, such as septic tanks. These latter waste waters generally return to and remain a part of the freshwater supply and are not susceptible to reclamation.

Information on waste water production for 1970 was derived from data published by the State Water Resources Control Board^{1/}, augmented with data published by the Department of Water Resources in its Bulletin No. 130 series^{2/}.

^{1/} State of California, State Water Resources Control Board. "An Inventory of Sewage Disposal Facilities in California". January 1970.

^{2/} State of California, Department of Water Resources. Bulletin No. 130-70. "Hydrologic Data: 1970". Appendix F. "Waste Water Data". 1971.

The quantities of waste water produced in 1971 were assembled from information obtained from the files of the various California Regional Water Quality Control Boards and from data collected by this Department for Appendix F of Bulletin 130-71, during the conduction of various waste water reclamation studies, and from water resources planning and water management studies.

These data on individual waste discharges, which have been aggregated into the 11 hydrologic study areas used by the Department in its statewide water resources planning studies as depicted in Figure 1, are presented for each year in Tables 1 through 6. A statewide summary of this information is shown on page 5.

This summary shows, as would be expected, the greatest waste water production was in the major populated areas. The population differences between 1970 and 1971 within each hydrologic study area reflect a combination of direct population shifts, agencies reported in one but not in the other year, and increases due to new areas being served by community sewers. Further, it should be noted that about 70 percent of the waste water production reported was discharged into saline waters during both 1970 and 1971.

WASTE WATER RECLAMATION PRACTICES

Most of the information on quantities and uses of reclaimed waste water for 1970 was compiled from data published

by the State Department of Public Health^{3/} and by the Water Management Technical Subcommittee for the Pacific Southwest Inter-Agency Committee^{4/}. These two sources of data were augmented with data contained in Appendix F of Bulletin No. 130-70.

The quantities and uses of reclaimed waste water for 1971 were assembled from information and data gathered from the same sources as were the 1971 waste water production data and information. The data on the quantities of waste water reclaimed are listed on Page 5 by hydrologic study area for both 1970 and 1971.

This summary indicates the quantities of waste water reused under planned reclamation schemes (controlled reuse of waste water) and the quantity reused incidentally (uncontrolled reuse of waste water), which results from disposal practices to natural bodies of water or as part of waste water treatment such as sewer farming. The term waste water reclamation, as used in this report, is the planned renovation of wastes with the intent of producing water for a specific beneficial purpose. The renovation may be the normal treatment process required for waste discharge or it may include further treatment to remove or neutralize specific pollutants.

a-The amount of waste water produces less the amount used in planned reclamation.

b-Ocean, bays, and estuaries.

c-Of the amount of waste water produced.

d-Discharges to Salton Sea and Colorado River.

e-The apparent large increase between 1970 and 1971 is due to the increased number of discharges reported for private enterprises - See Table 20 and 21 end Table 6 (Pages 33 through 35)

This summary shows that the South Coastal and Tulare Basin areas rival each other in reclaiming most of the waste water in the State. However, during 1970, the Tulare Basin reclaimed about 75 percent of its waste waters and 70 percent during 1971, while the South Coastal area was reclaiming only about 5 percent of its wastes during 1970 and 1971. The rate of reclamation in the South Coastal area is comparable in percentage to the other coastal areas and to the Sacramento Basin and Delta areas, which reclaim less than 10 percent of the waste water production they report.

In inland basins the majority of the waste water produced is either reclaimed and reused or returned to and commingled with the freshwater supply for further use. Reclamation of these waters might conceivably upgrade water quality. However, it would not create a "new" water supply. Only when wastes are discharged to saline waters, or have become so degraded that they cannot be discharged to fresh waters, does their reclamation create a new supply. Thus, possible sources of new water include the municipal and industrial wastes discharged to the ocean, saline bays, and estuaries, and the agricultural waste waters in the San Joaquin Valley so saline they eventually must be collected and removed from the freshwater cycle.

Over one-half of the waste water produced in each of the coastal basins is discharged to saline waters.

Statewide, the amount discharged to saline water exceeds 70 percent of the waste water production reported by 766 dischargers in 1970 and 805 dischargers in 1971.

ARRANGEMENT OF TABLES

Data in Tables 1 and 4 report upon the production, reclamation, and disposal of waste water by municipalities for the calendar years of 1970 and 1971, respectively. Other municipal waste water production, reclamation, and disposal data are presented in Tables 2, 3, 5, and 6.

Data in Tables 2 and 5 report upon the production, reclamation, and disposal of waste water at federal installations for the calendar years 1970 and 1971, respectively. Such water may be municipal, industrial, or domestic waste water.

Data in Tables 3 and 6 report upon the production, reclamation, and disposal of waste water by private enterprises for the calendar years 1970 and 1971, respectively. Such water may be from waste water from municipal, domestic, or discrete industrial discharges.
